

## Field & Dataset Security for Microsoft Dynamics® NAV

The Field & Dataset Security module of NAV 2-Controlware™ enables you to refine the authorizations up to field and dataset level. It provides the solution for users to take responsibility for their own data. The module is the solution for implementing ‘waterproof’ segregation of duties.

### Refine your authorizations up to field & dataset level

With the standard available application controls data owners are not able to take their responsibility. Often, other users need access to fields or sets of records of the same data. With the Field & Dataset Security module data owners are able to delegate parts of their datasets to other users.

The module Field & Dataset Security you can:

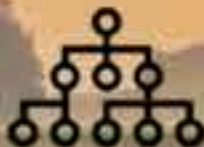

- easily refine the object authorizations to fields.
- authorize groups of users to filtered records for editing or viewing.
- prefill fields whereafter it's not possible to change them.
- separate permissions in tables with duplicate functions.
- refine authorizations for all tables.
- add specific filters or trigger controls for exceptions.
