

Mandatory Fields for Microsoft Dynamics® NAV

The Mandatory Fields module of NAV 2-Controlware™ provides the possibility to validate fields: mandatory or according predefined filters or length. No more incomplete master data or gaps in information processing thanks to the Mandatory Fields module.

Enhance the quality of your internal information processing

Determine for each table which requirements the value of the field must meet. Depending on the setting, the user will receive a warning or an error.

With the module Mandatory Fields you can:

- apply field validation: mandatory or according to predefined filters.
- apply different types of warnings or errors.
- increase work comfort because of reduced risks on manual errors.
- apply rules for companies only and/or group of users.
